PROBLEM AND MOTIVATION

- Reinforcement Learning (RL): find optimal policy $\pi*$
- Policy optimization: given a class of policies, find the policy parameters maximizing $J(\pi_{\theta})$ (Sutton et al.,

$$J(\pi_{\boldsymbol{\theta}}) = \int_{\mathcal{S}} \mu_0(s) V^{\pi_{\boldsymbol{\theta}}}(s) \, ds = \int_{\mathcal{S}} \mu_0(s) \int_{\mathcal{A}} \pi_{\boldsymbol{\theta}}(a|s) Q^{\pi_{\boldsymbol{\theta}}}(s,a) \, da \, ds$$

• Problem: value functions are defined for a single policy. During optimization, the information on previous policies is potentially lost

OFF-POLICY RL

- Given data obtained from a behavioral policy π_b , find optimal policy π_{θ^*}
- The objective to maximize becomes:

$$J(\pi_{\boldsymbol{\theta}}) = \int_{\mathcal{S}} d^{\pi_b}(s) V^{\pi_{\boldsymbol{\theta}}}(s) \, \mathrm{d}s = \int_{\mathcal{S}} d^{\pi_b}(s) \int_{\mathcal{A}} \pi_{\boldsymbol{\theta}}(a|s) Q^{\pi_{\boldsymbol{\theta}}}(s,a) \, \mathrm{d}a \, \mathrm{d}s,$$
 where $d^{\pi_b}(s)$ is the limiting distribution under π_b

- Problem: when computing $\nabla_{\theta} J(\pi_{\theta})$, traditional offpolicy policy gradients ignore $\nabla_{\theta}Q^{\pi_{\theta}}(s,a)$: the gradient of the action-value function
- When the policy is stochastic, the gradient is often approximated (Degris et al., 2012) by:

$$\nabla_{\boldsymbol{\theta}} J(\pi_{\boldsymbol{\theta}}) \approx \mathbb{E}_{s \sim d^{\pi_b}(s), a \sim \pi_b(.|s)} \left[\frac{\pi_{\boldsymbol{\theta}}(a|s)}{\pi_b(a|s)} \left(Q^{\pi_{\boldsymbol{\theta}}}(s, a) \nabla_{\boldsymbol{\theta}} \log \pi_{\boldsymbol{\theta}}(a|s) \right) \right]$$

 When the policy is deterministic, the gradient is often approximated (Silver et al., 2014) by:

$$\nabla_{\boldsymbol{\theta}} J_b(\pi_{\boldsymbol{\theta}}) \approx \mathbb{E}_{s \sim d^{\pi_b}(s)} \left[\nabla_a Q^{\pi_{\boldsymbol{\theta}}}(s, a) |_{a = \pi_{\boldsymbol{\theta}}(s)} \nabla_{\boldsymbol{\theta}} \pi_{\boldsymbol{\theta}}(s) \right]$$

PVFs

- We augment traditional value functions by giving as input also the policy parameters
- **PSSVF**: Parameter based start-state-value function

$$V(\boldsymbol{\theta}) := \mathbb{E}[R_0|\boldsymbol{\theta}]$$

• **PSVF**: Parameter based state-value function

$$V(s, \boldsymbol{\theta}) := \mathbb{E}[R_t | s_t = s, \boldsymbol{\theta}]$$

• PAVF: Parameter based action-value function

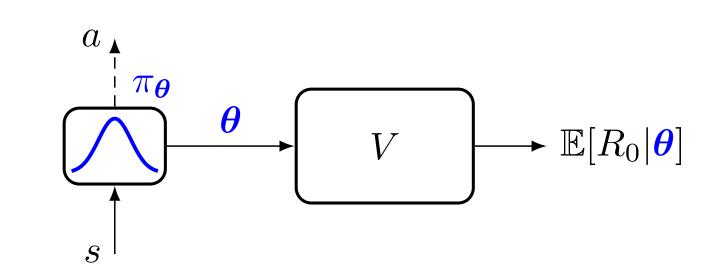

$$Q(s, a, \boldsymbol{\theta}) := \mathbb{E}[R_t | s_t = s, a_t = a, \boldsymbol{\theta}]$$

- Parameter-based value functions (PBVFs) are defined for any policy and can generalize in the policy space
- The term $\nabla_{\theta} Q(s, a, \theta)$ can be directly computed
- PSSVF directly estimates the RL objective
- PSVF and PAVF are able to both **perform direct search** in parameter space AND use Temporal Difference for learning

PSSVF

- Stochastic or deterministic policies
- Find the policy π_{θ} maximizing $J(\pi_{\theta})$:

$$J(\pi_{\boldsymbol{\theta}}) = \mathbb{E}[R_0|\boldsymbol{\theta}] = V(\boldsymbol{\theta})$$

• Taking the gradient of $J(\pi_{\theta})$ we obtain:

• Find the policy π_{θ} maximizing $J(\pi_{\theta})$:

• Taking the gradient of $J(\pi_{\theta})$ we obtain:

 $+ \nabla_{\boldsymbol{\theta}} Q(s, a, \boldsymbol{\theta}))]$

STOCHASTIC PAVF

Stochastic policies

$$\nabla_{\boldsymbol{\theta}} J(\pi_{\boldsymbol{\theta}}) = \nabla_{\boldsymbol{\theta}} V(\pi_{\boldsymbol{\theta}})$$

 $J(\pi_{\boldsymbol{\theta}}) = \int_{\mathcal{S}} d^{\pi_b}(s) \int_{\Lambda} \pi_{\boldsymbol{\theta}}(a|s) Q(s, a, \boldsymbol{\theta}) \, \mathrm{d}a \, \mathrm{d}s$

 $\rightarrow \mathbb{E}[R_t|s_t=s,a_t=a,\theta]$

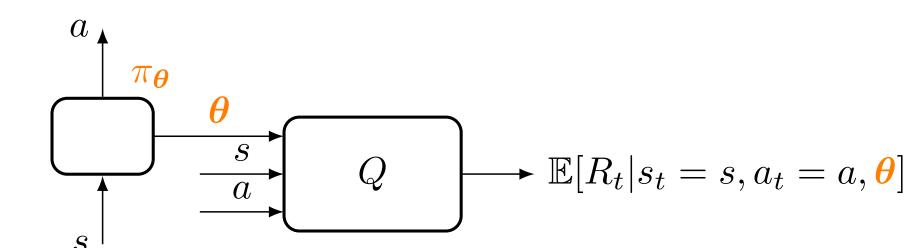

- Deterministic policies
- Find the policy π_{θ} maximizing $J(\pi_{\theta})$:

• Taking the gradient of $J(\pi_{\theta})$ we obtain:

Stochastic or deterministic policies

• Find the policy π_{θ} maximizing $J(\pi_{\theta})$:

$$J(\boldsymbol{\pi_{\theta}}) = \int_{S} d^{\pi_{b}}(s) Q(s, \boldsymbol{\pi_{\theta}}(s), \boldsymbol{\theta}) ds$$

• Taking the gradient of $J(\pi_{\theta})$ we obtain:

$$\nabla_{\boldsymbol{\theta}} J(\boldsymbol{\pi}_{\boldsymbol{\theta}}) = \mathbb{E}_{s \sim d^{\pi_{b}}(s)} \left[\nabla_{a} Q(s, a, \boldsymbol{\theta}) |_{a = \boldsymbol{\pi}_{\boldsymbol{\theta}}(s)} \nabla_{\boldsymbol{\theta}} \boldsymbol{\pi}_{\boldsymbol{\theta}}(s) \right.$$
$$+ \left. \nabla_{\boldsymbol{\theta}} Q(s, a, \boldsymbol{\theta}) |_{a = \boldsymbol{\pi}_{\boldsymbol{\theta}}(s)} \right]$$

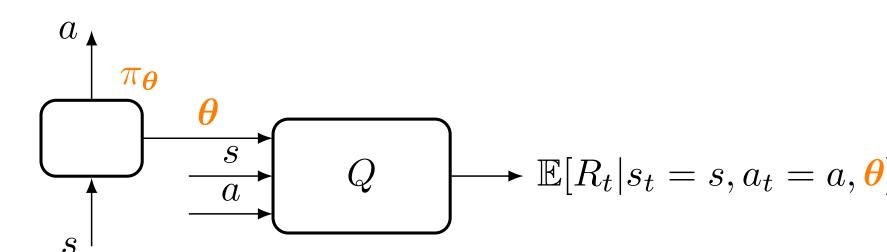

DETERMINISTIC PAVF

PSVF

$$J(\pi_{\boldsymbol{\theta}}) = \int_{\mathcal{S}} d^{\pi_b}(s) Q(s, \pi_{\boldsymbol{\theta}}(s), \boldsymbol{\theta}) \, \mathrm{d}s$$

 $\nabla_{\boldsymbol{\theta}} J(\pi_{\boldsymbol{\theta}}) = \mathbb{E}_{s \sim d^{\pi_b}(s)} [\nabla_{\boldsymbol{\theta}} V(s, \boldsymbol{\theta})]$

 $\rightarrow \mathbb{E}[R_t|s_t=s, \theta]$

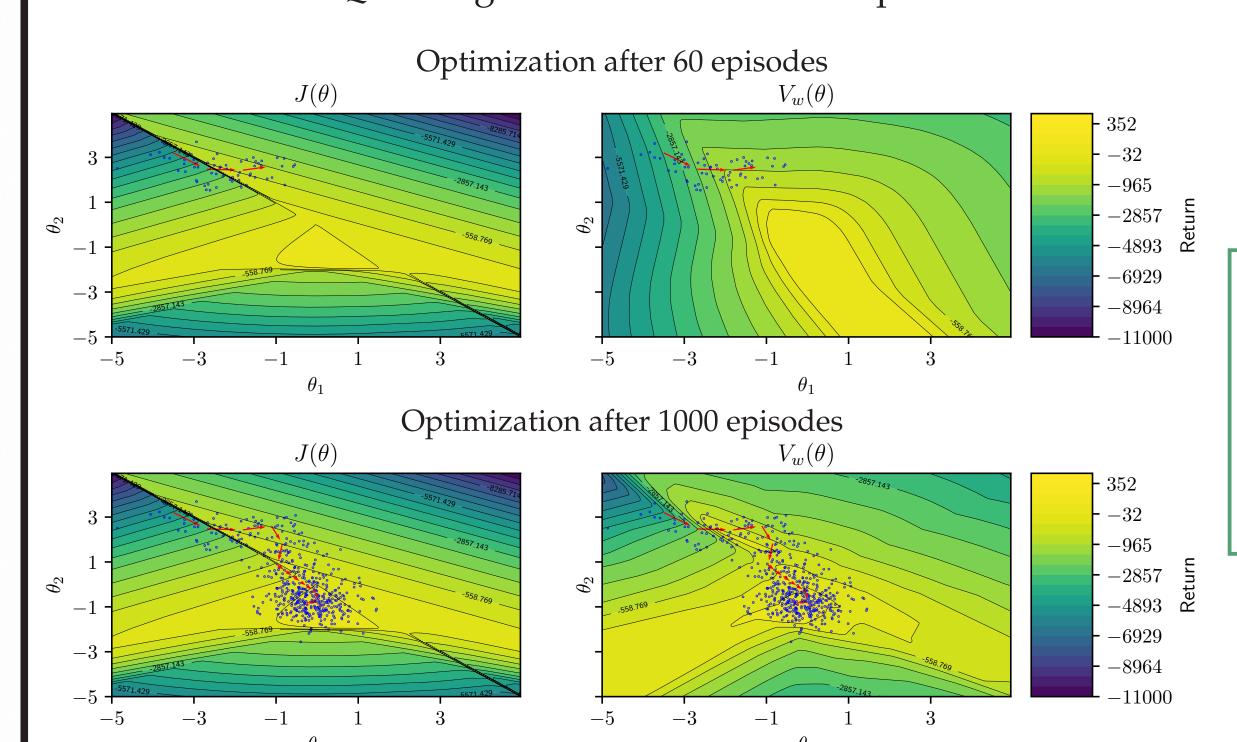

$$\nabla_{\boldsymbol{\theta}} J(\boldsymbol{\pi}_{\boldsymbol{\theta}}) = \mathbb{E}_{s \sim d^{\pi_{b}}(s)} \left[\nabla_{a} Q(s, a, \boldsymbol{\theta}) |_{a = \boldsymbol{\pi}_{\boldsymbol{\theta}}(s)} \nabla_{\boldsymbol{\theta}} \boldsymbol{\pi}_{\boldsymbol{\theta}}(s) \right] + \nabla_{\boldsymbol{\theta}} Q(s, a, \boldsymbol{\theta}) |_{a = \boldsymbol{\pi}_{\boldsymbol{\theta}}(s)}$$

ACTOR-CRITIC ALGORITHMS

PSSVF on LQR using deterministic shallow policies

 $\nabla_{\boldsymbol{\theta}} J(\boldsymbol{\pi}_{\boldsymbol{\theta}}) = \mathbb{E}_{s \sim d^{\pi_b}(s), a \sim \pi_b(.|s)} \left[\frac{\pi_{\boldsymbol{\theta}}(a|s)}{\pi_b(a|s)} \left(Q(s, a, \boldsymbol{\theta}) \nabla_{\boldsymbol{\theta}} \log \pi_{\boldsymbol{\theta}}(a|s) \right) \right]$

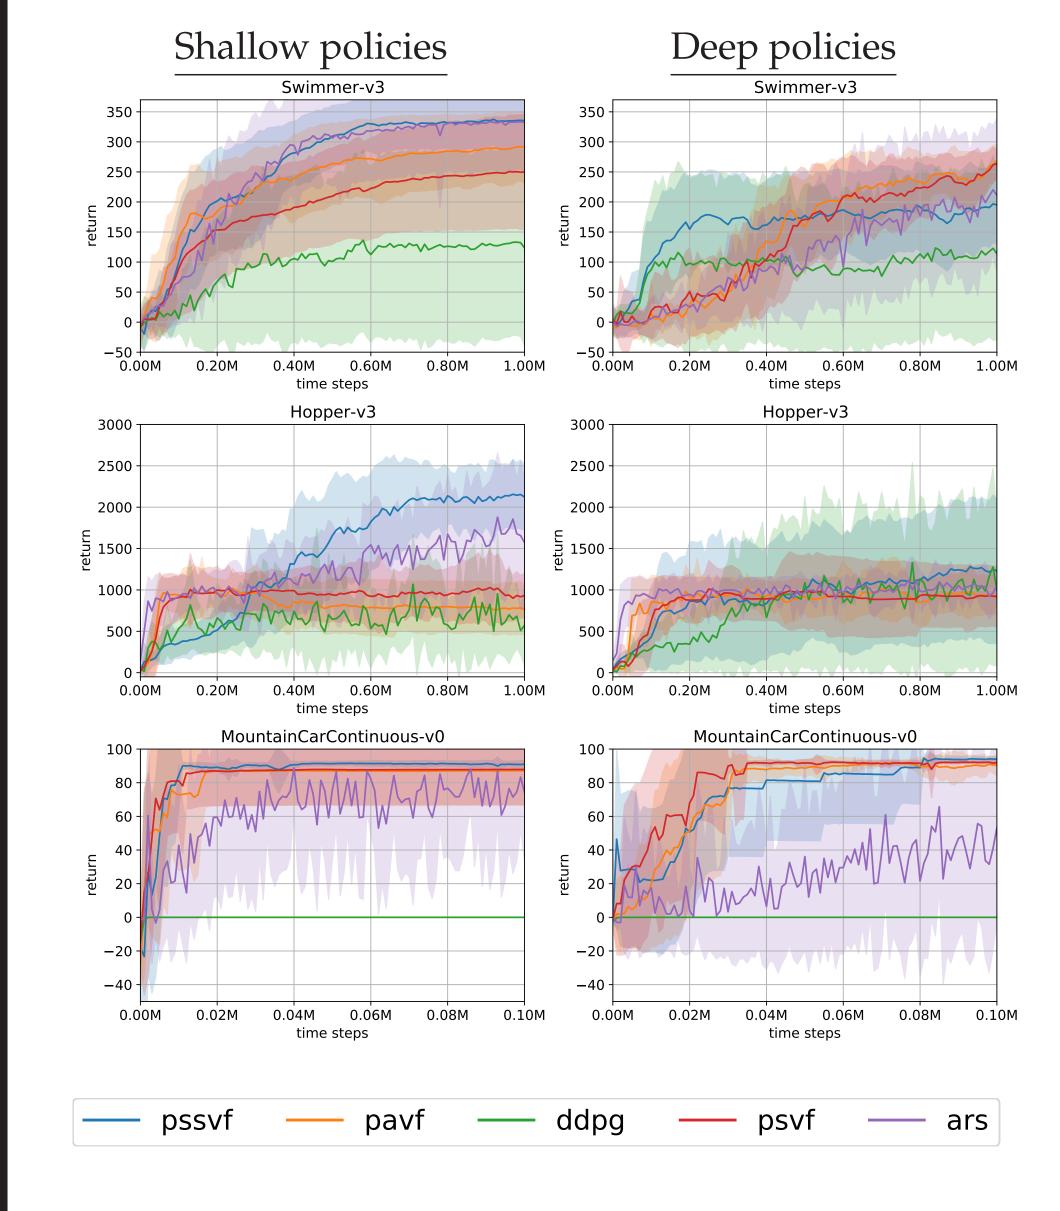

trajectory optimization for $\pi_{\theta} : \rightarrow$

Off-policy actor-critic with PBVFs Given the behavioral π_b , find π_{θ} maximizing $J(\theta)$:

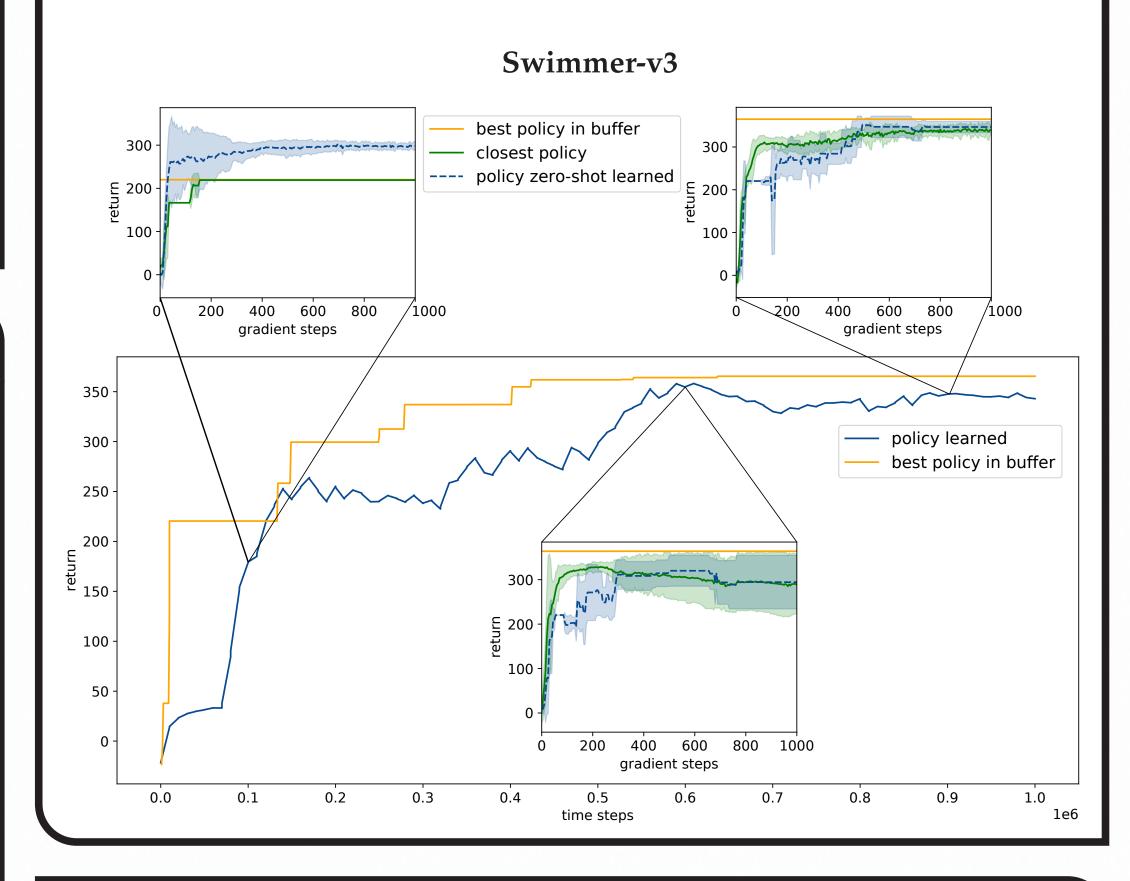

- 1. Collect data with π_b (expensive in RL)
- 2. Use data to train $V(\theta)$, $V(s, \theta)$ or $Q(s, a, \theta)$
- 3. Find π_{θ} following $\nabla_{\theta} J(\pi_{\theta})$ (offline optimization)
- 4. Set new behavioral $\pi_{\theta} \leftarrow \pi_{b}$
- 5. Repeat until convergence

EXPERIMENTS

• Comparison with DDPG (Lillicrap et al., 2015) and ARS (Mania et al., 2018) using deterministic policies

 Zero-shot learning performance of PSSVF using deterministic shallow policies
